

Charity dApp

Decentralized Charity Crowdfunding DApp

Oryngul Maratova, Danelya Bekzhan, Aigerim Kazbek
SE-2426

About the project

This project is a decentralized crowdfunding application built on the Ethereum Sepolia test network.

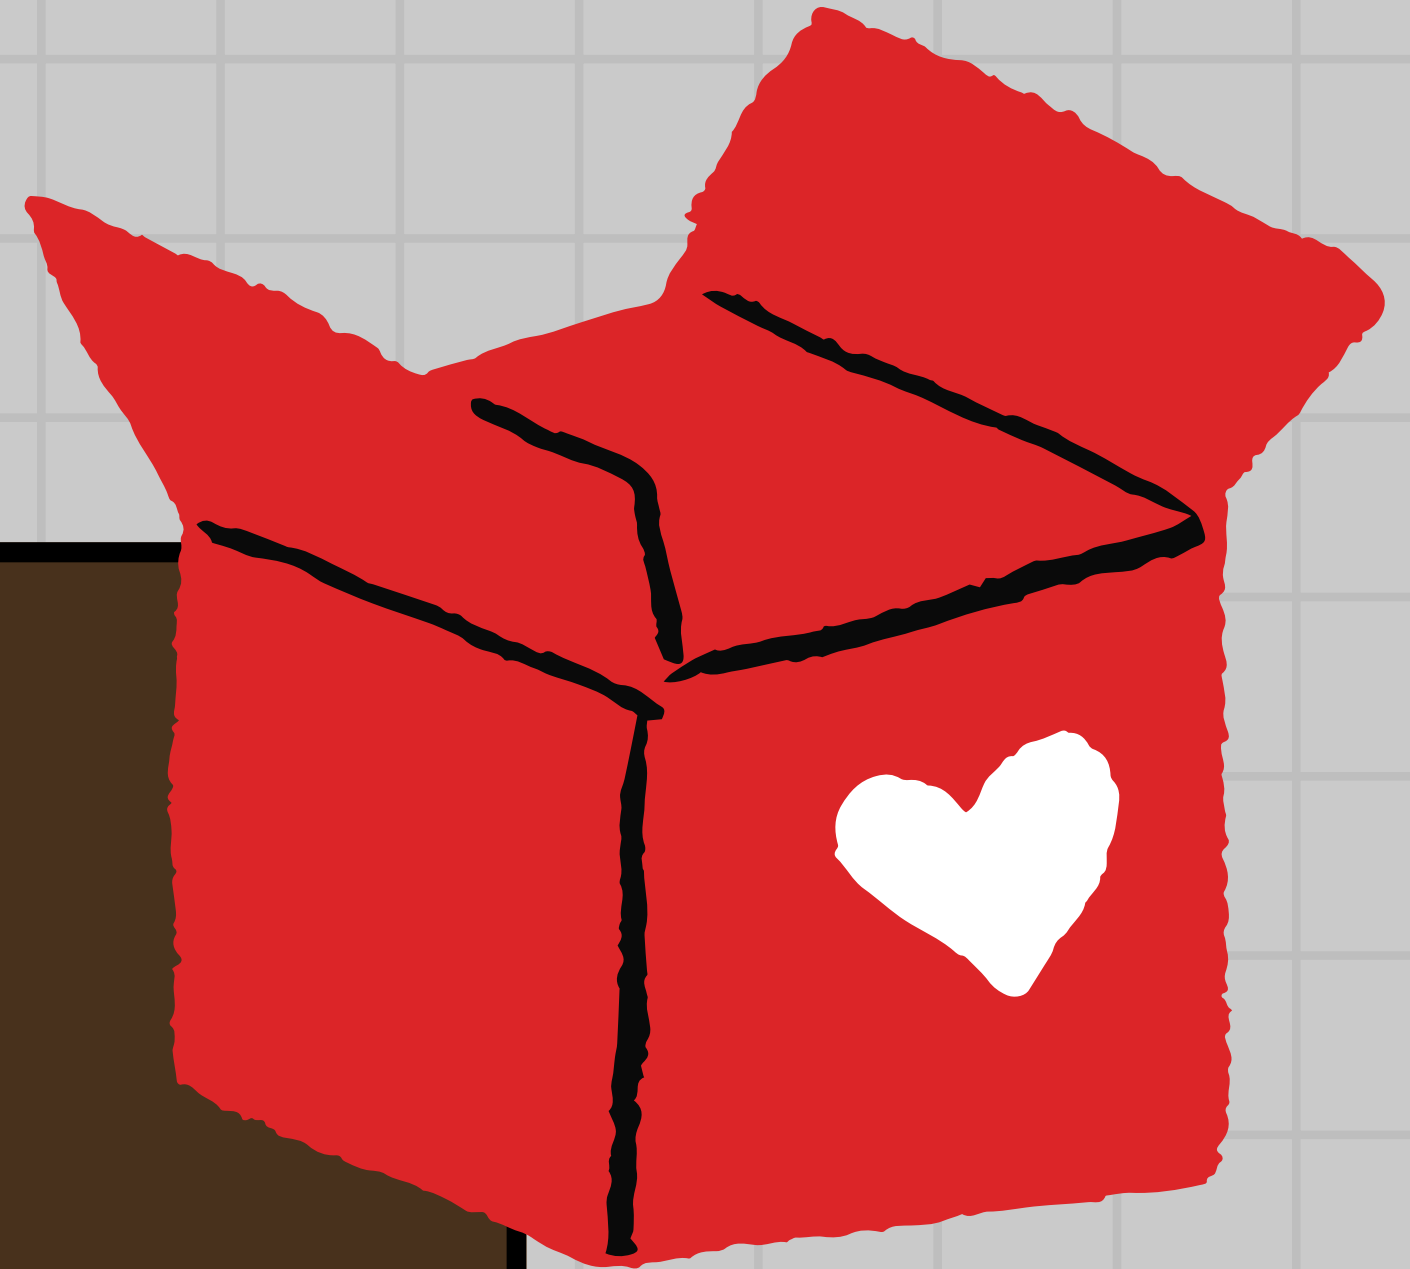

Analyzing the problem

Today many crowdfunding platforms are centralized.

This means:

- users must trust a single company,
- transaction history is not always transparent,
- fees can be high,
- data can be changed or hidden.

Examples: GoFundMe, Patreon

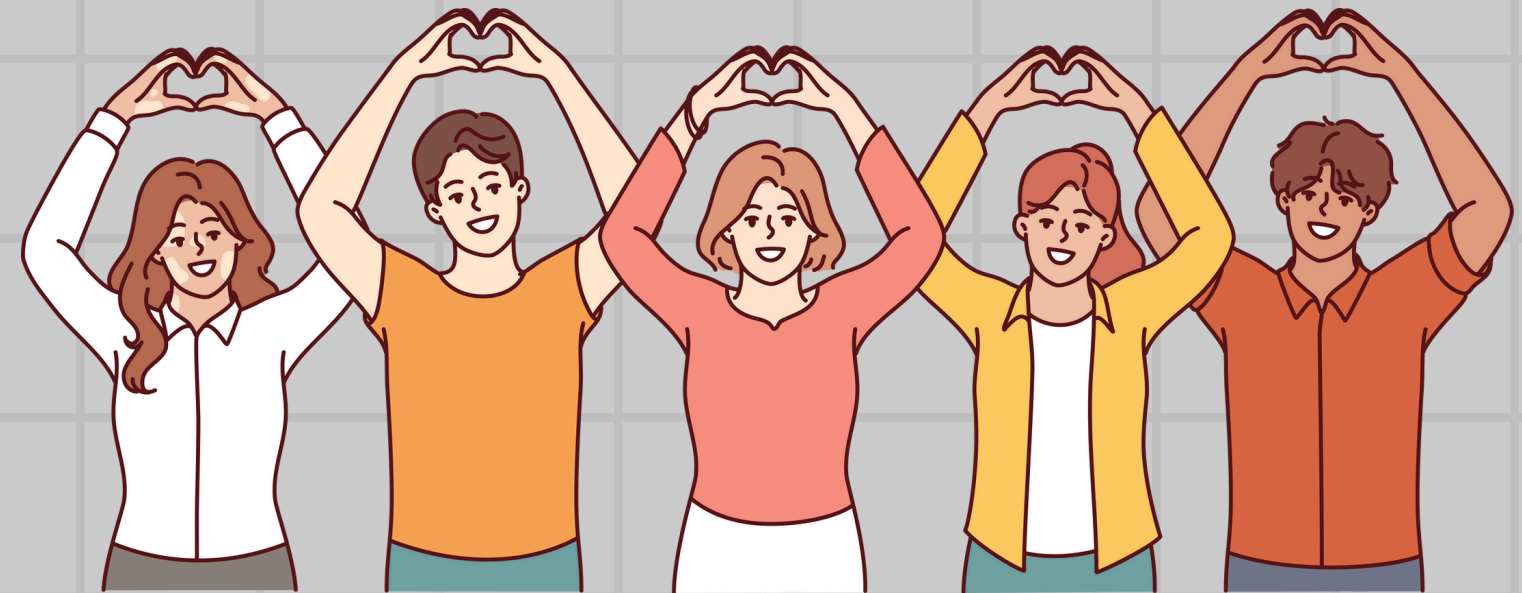

Idea of the Project

The idea is to create a decentralized charity platform where:

- all transactions are stored on blockchain,
- no central authority controls the funds,
- everyone can verify donations,
- users interact directly with smart contracts
- MetaMask wallet is integrated for secure login and transaction approval.

How It Works (Concept)

- A user creates a campaign with a goal and deadline.
- Users donate test ETH.
- Donors receive reward tokens automatically.
- After the deadline:
- if goal is reached - funds go to beneficiary,
- if goal is not reached - donors can refund.

Key Features

Campaign creation

Automatic reward tokens

**MetaMask
integration**

Results

Charity DApp

Network: Sepolia • Crowdfunding + ERC-20 reward token

Account: **0x789378dD1ee77fEe7C2c79978cF3D1cf7B08048c** Chain: **11155111**

Connect MetaMask

Refresh balances

Load campaigns

ETH: **0.030908592366561222**

Token: **10.0 RWD**

Create campaign

Campaign title

Help Fund

Beneficiary (optional)

0x... (leave empty = your address)

Goal (ETH)

0.5

Duration (seconds)

60

Create

Contribute

Campaign ID

0

Amount (ETH)

0.01

Donate

My contribution

Campaign ID

0

Show my contribution

My contribution (ETH): **0.01**

Campaigns

#0 Help Fund

goal: 0.5 ETH | raised: 0.01 ETH

status: active=false finalized=true successful=false

Finalize / Refund

Campaign ID

0

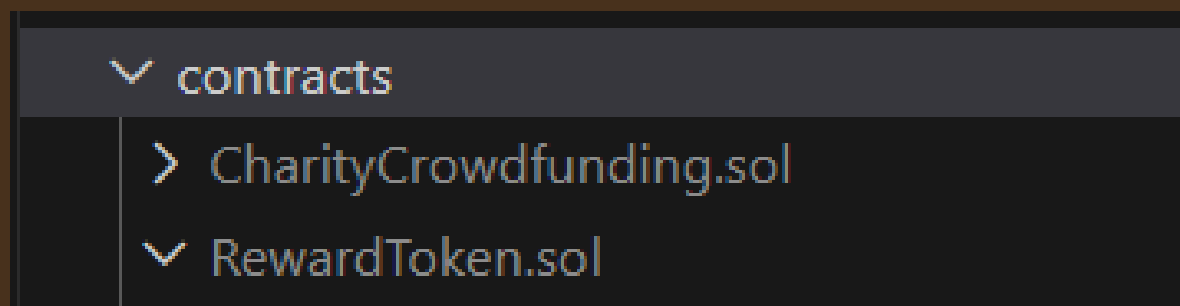

Finalize

Refund

Tip: Finalize works only after deadline. Refund works only if campaign failed + finalized + you contributed.

Technologies Used

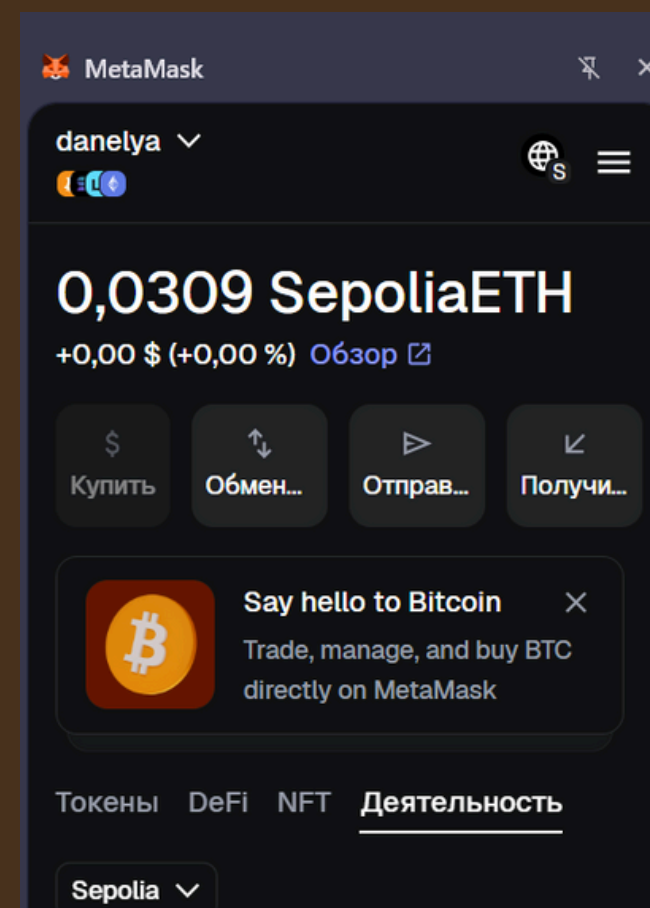

Solidity smart contracts

ERC-20 reward token standard

```
contracts > RewardToken.sol > RewardToken > setMinter
1 // SPDX-License-Identifier: MIT
2 pragma solidity ^0.8.20;
3
4 import "@openzeppelin/contracts/token/ERC20/ERC20.sol";
5 import "@openzeppelin/contracts/access/Ownable.sol";
6
7 /// Reward token
8 contract RewardToken is ERC20, Ownable {
9
10     // address that is allowed to mint tokens
11     address public minter;
12 }
```

Ethereum Sepolia test network (with MetaMask)

Alchemy (RPC connection)

Conclusion

This project shows how decentralized technology can improve trust in fundraising systems.

It demonstrates practical blockchain skills such as smart contract development, wallet integration, and DApp interaction.

Thank You for attention!
